

# Next Generation OP07, Ultralow Offset Voltage Operational Amplifier

**OP77** 

### **FEATURES**

- · Outstanding Gain Linearity
- Ultra High Gain ...... 5000V/mV Min
- + Low V  $_{\mbox{\scriptsize OS}}$  Over Temperature ...... 60  $\mu\mbox{\scriptsize V}$  Max
- Excellent TCV<sub>os</sub>. ...... 0.3μV/°C Max
- High PSRR ......3µV/V Max
   Low Power Consumption ......60mW Max
- Fits OP-07, 725, 108A/308A, 741 Sockets
- · Available in Die Form

- For devices processed in total compliance to MIL-SDT-883, add/883 after part number. Consult factory for 883 data sheet.
- Burn-in is available on commercial and industrial temperature range parts in CerDIP, plastic DIP, and TO-can packages.
- th For availability and burn-in information on SO and PLCC packages, contact your local sales office.

### **GENERAL DESCRIPTION**

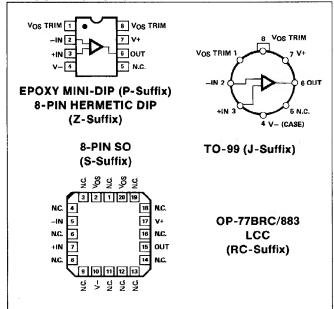

The OP-77 significantly advances the state-of-the-art in precision op amps. The OP-77's outstanding gain of 10,000,000 or more is maintained over the full  $\pm 10$ V output range. This exceptional gain-linearity eliminates incorrectable system nonlinearities common in previous monolithic op amps, and provides

superior performance in high closed-loop-gain applications. Low initial  $V_{OS}$  drift and rapid stabilization time, combined with only 50mW power consumption, are significant improvements over previous designs. These characteristics, plus the exceptional TCV $_{OS}$  of 0.3 $\mu$ V/°C maximum and the low  $V_{OS}$  of 25 $\mu$ V maximum, eliminates the need for  $V_{OS}$  adjustment and increases system accuracy over temperature.

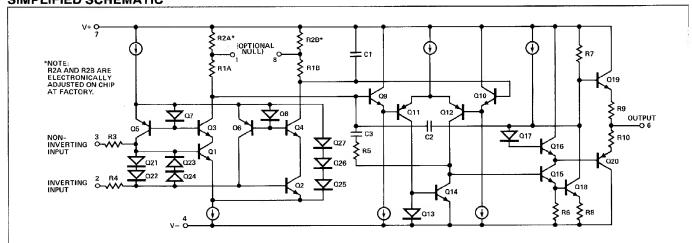

PSRR of  $3\mu V/V$  (110dB) and CMRR of  $1.0\mu V/V$  maximum virtually eliminiate errors caused by power supply drifts and common-mode signals. This combination of outstanding characteristics makes the OP-77 ideally suited for high-resolution instrumentation and other tight error budget systems.

### **PIN CONNECTIONS**

### SIMPLIFIED SCHEMATIC

### 0P77

This product is available in six standard grades and five standard packages: the TO-99 can, the 8-pin mini-DIP in ceramic, SO or epoxy, and the 20-contact LCC.

The OP-77 is a direct or upgrade replacement for the OP-07, 05, 725, or 108A op amps. 741-types can be replaced by eliminating the  $V_{\rm OS}$  adjust pot. For higher precision performance refer to OP-177.

| 8-Pin SO (S)            | 158                      | 43              | °C/W  |

- 1. For supply voltages less than ±22V, the absolute maximum input voltage is equal to the supply voltage.
- 2. Absolute maximum ratings apply to both DICE and packaged parts, unless otherwise noted.
- $\Theta_{jA}$  is specified for worst case mounting conditions, i.e.,  $\Theta_{jA}$  is specified for device in socket for TO, CerDIP, P-DIP, and LCC packages;  $\Theta_{jA}$  is specified for device soldered to printed circuit board for SO package.

### **ELECTRICAL CHARACTERISTICS** at $V_S = \pm 15V$ , $T_A = +25$ °C, unless otherwise noted.

- Excluding the initial hour of operation, changes in  $V_{OS}$  during the first 30 operation. ating days are typically  $2.5\mu V$ .
- 2. Sample tested.
- 3. Guaranteed by design.

<sup>1.</sup> Long-Term Input Offset Voltage Stability refers to the averaged trend line of  $V_{OS}$  vs Time over extended periods after the first 30 days of operation.

### NOTES:

<sup>1.</sup> Long-Term Input Offset Voltage Stability refers to the averaged trend line congression in part voltage stability refers to the averaged trend line of V<sub>OS</sub> vs. Time over extended periods after the first 30 days of operation. Excluding the initial hour of operation, changes in V<sub>OS</sub> during the first 30 operating days are typically 2.5 μV.
 Sample tested.

<sup>3.</sup> Guaranteed by design.

#### NOTES:

- 1. OP-77E:  $TCV_{OS}$  is 100% tested on J and Z packages.
- 2. Guaranteed by end-point limits.

### **OPEN-LOOP GAIN LINEARITY**

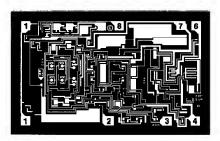

Actual open-loop voltage gain can vary greatly at various output voltages. All automated testers use end-point testing and therefore only show the average gain. This causes errors in high closed-loop gain circuits. Since this is so difficult for manufacturers to test, you should make your own evaluation. This simple test circuit makes it easy. An ideal op amp would show a horizontal scope trace.

This is the output gain linearity trace for the new OP-77. The output trace is virtually horizontal at all points, assuring extremely high gain accuracy. The average open-loop gain is truly impressive – approximately 10,000,000.

### NOTES:

Electrical tests are performed at wafer probe to the limits shown. Due to variations in assembly methods and normal yield loss, yield after packaging is not guaranteed for standard product dice. Consult factory to negotiate specifications based on dice lot qualification through sample lot assembly and testing.

### **OP77**

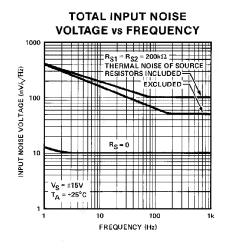

### **TYPICAL PERFORMANCE CHARACTERISTICS**

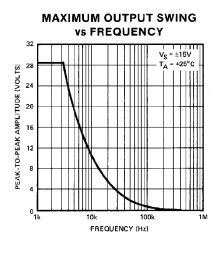

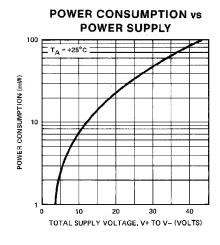

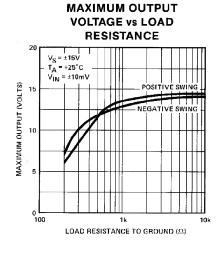

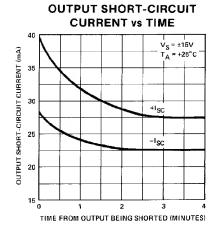

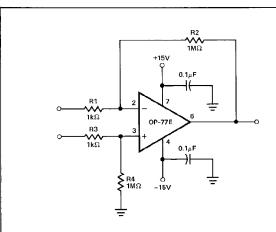

### **APPLICATIONS INFORMATION**

### PRECISION HIGH-GAIN DIFFERENTIAL AMPLIFIER

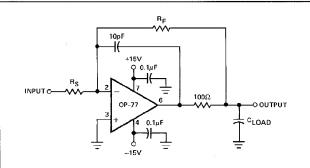

The high gain, gain linearity, CMRR, and low TCV<sub>OS</sub> of the OP-77 make it possible to obtain performance not previously available in single stage very high-gain amplifier applications.

For best CMR,  $\frac{R1}{R2}$  must equal  $\frac{R3}{R4}$ . In this example,

with a 10 mV differential signal, the maximum errors are as listed.

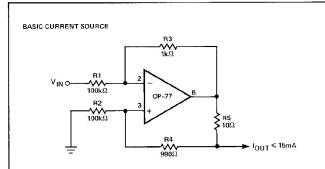

| TYPE                       | AMOUNT    |
|----------------------------|-----------|
| COMMON-MODE VOLTAGE        | 0.01%/V   |
| GAIN LINEARITY, WORST CASE | 0.02%     |
| TCV <sub>OS</sub>          | 0.003%/°C |
| TCI <sub>OS</sub>          | 0.008%/°C |

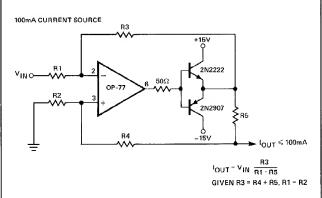

#### ISOLATING LARGE CAPACITIVE LOADS

This circuit reduces maximum slew-rate but allows driving capacitive loads of any size without instability. Because the  $100\Omega$  resistor is inside the feedback loop, its effect on output impedance is reduced to insignificance by the high open-loop gain of the OP-77.

### **BILATERAL CURRENT SOURCE**

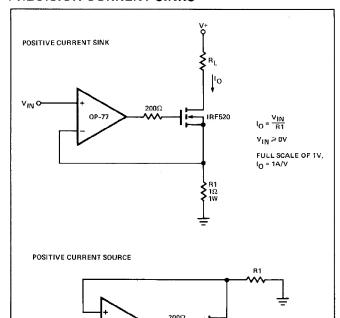

These current sources will supply both positive and negative current into a grounded load.

Note that 
$$Z_0 = \frac{R5 \left(\frac{R4}{R2} + 1\right)}{\frac{R5 + R4}{R2} - \frac{R3}{R1}}$$

and that for Z<sub>O</sub> to be infinite,

$$\frac{R5 + R4}{R2} \text{ must} = \frac{R3}{R1}.$$

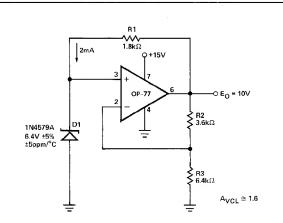

#### PRECISION CURRENT SINKS

These simple high current sinks require that the load float between the power supply and the sink.

In these circuits, OP-77's high gain, high CMRR, and low  $\rm TCV_{OS}$  assure high accuracy.

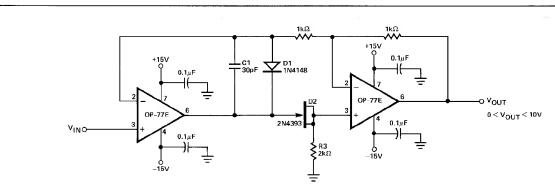

### HIGH STABILITY VOLTAGE REFERENCE

This simple bootstrapped voltage reference provides a precise 10 volts virtually independent of changes in power supply voltage, ambient temperature, and output loading. Correct zener operating current of exactly 2mA is maintained by R1, a selected 5ppm/°C resistor, connected to the regulated output. Accuracy is primarily determined by three factors: the 5ppm/°C temperature coefficient of D1, 1ppm/°C ratio tracking of R2 and R3, and operational amplifier  $V_{OS}$  errors.

 $V_{OS}$  errors, amplified by 1.6 (A<sub>VCL</sub>), appear at the output and can be significant with most monolithic amplifiers. For example: an ordinary amplifier with TCV<sub>OS</sub> of  $5\mu$ V/°C contributes 0.8ppm/°C of output error while the OP-77, with TCV<sub>OS</sub> of  $0.3\mu$ V/°C, contributes but 0.05ppm/°C of output error, thus effectively eliminating TCV<sub>OS</sub> as an error consideration.

### PRECISION ABSOLUTE VALUE AMPLIFIER

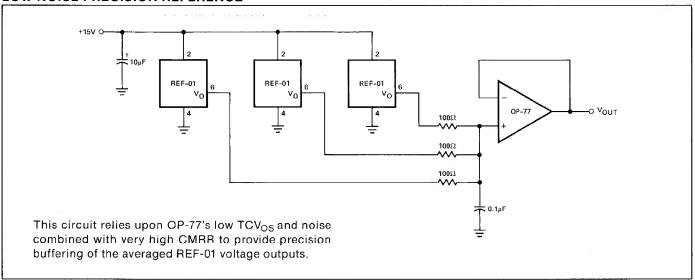

V<sub>IN</sub> ≤ 0V

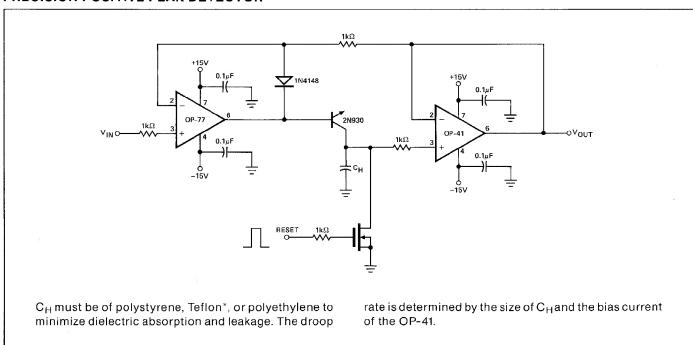

The high gain and low  $TCV_{OS}$  assure accurate operation with inputs from microvolts to volts. In this circuit, the signal always appears as a common-mode signal to

the op amps. The OP-77E CMRR of  $1\mu V/V$  assures errors of less than 2ppm.

### LOW NOISE PRECISION REFERENCE

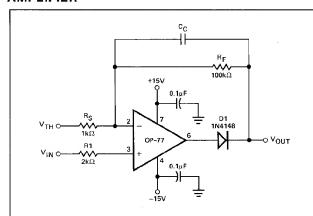

### PRECISION POSITIVE PEAK DETECTOR

<sup>\*</sup>Teflon is a registered trademark of the Dupont Company.

### **OP77**

## PRECISION THRESHOLD DETECTOR/AMPLIFIER

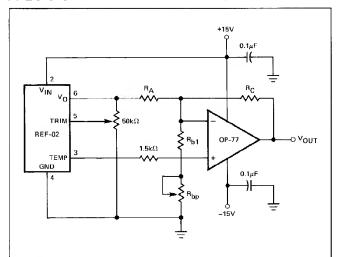

When  $V_{IN} < V_{TH}$ , amplifier output swings negative, reverse biasing diode D1.  $V_{OUT} = V_{TH}$  if  $R_L = \infty$ . When  $V_{IN} \! \geq V_{TH}$ , the loop closes,

$$V_{OUT} = V_{TH} + (V_{IN} - V_{TH}) \left(1 + \frac{R_F}{R_S}\right).$$

 $C_{C}$  is selected to smooth the response of the loop.
